Length Converter

Muharib

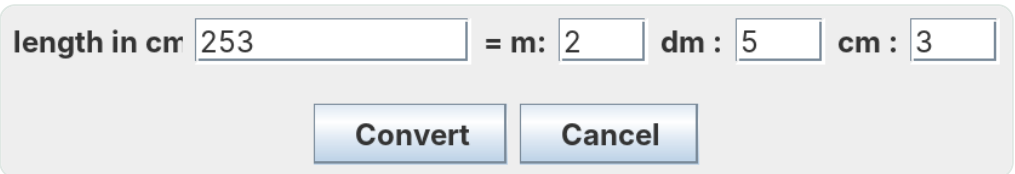

01 Questions

Problem GUI

Create the GUI "Converter" that converts a length in cm into m, dm and cm (1 m = 100 cm, 1 dm = 10 cm). Example: 253 cm = 2 m, 5 dm, 3 cm.

- The button **Convert** performs the conversion.
- The button **Cancel** clears the fields.

Exception scenarios:
(1) A dialog "Input Error": "enter a positive value" should appear when the user enters a negative value.
(2) NumberFormatException: thrown when the input in the JTextField cannot be parsed as a number. Dialog "Error: Input Format": "Enter the seconds as a numerical Value".

Code WRITE THE CLASS

Write the class Converter: the components as attributes, inner classes for the two

buttons, and the exceptions handled with JOptionPane.
